## **2019** Consumer Confidence Report

|   | -   |
|---|---|
| Water System Name: Indian Creek Westridge CSD   | Report Date: 6/1/2020   |
|   | nts as required by state and federal regulations. This report shows the December 31, <mark>2019</mark> and may include earlier monitoring data.   |
| Este informe contiene información muy important<br>Westridge CSD 1410005 para asistirlo en español.   | e sobre su agua para beber. Favor de comunicarse Indian Creek   |
| 0   | ells<br>three locations within the District boundaries. Well 4 is inactive and<br>r monthly groundwater monitoring.   |
|   | nonuny groundwater monitoring.  |
| is<br>as<br>se  | the source water assessment was completed in 2010. The water source<br>considered to the most vulnerable to the following activity not<br>sociated with any detected contaminants, sewer system and gasoline<br>rvice station. The complete assessment is available for review in the<br>istrict offices.   |
| Time and place of regularly scheduled board meetings for  | br public participation:<br>6:00PM at the Christian Science Church,<br>2956 W. Line St., on the second Tuesday<br>in February, May, August and<br>November.   |
| For more information, contact: Terry Tye  | Phone: (760) 920-1472   |
| TERMS US  | SED IN THIS REPORT  |
| <b>Maximum Contaminant Level (MCL)</b> : The highest let<br>of a contaminant that is allowed in drinking water. Prim<br>MCLs are set as close to the PHGs (or MCLGs) as<br>economically and technologically feasible. Second<br>MCLs are set to protect the odor, taste, and appearance<br>drinking water.  | <ul> <li>ary contaminants that affect taste, odor, or appearance of the drinking water. Contaminants with SDWSs do not affect the health at the MCL levels.</li> <li>of Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.</li> </ul>  |
| Maximum Contaminant Level Goal (MCLG): The le<br>of a contaminant in drinking water below which there is<br>known or expected risk to health. MCLGs are set by<br>U.S. Environmental Protection Agency (U.S. EPA).<br><b>Public Health Goal (PHG)</b> : The level of a contaminant<br>drinking water below which there is no known or expec<br>risk to health. PHGs are set by the California Environmer<br>Protection Agency.  | <ul> <li>no contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.</li> <li>Variances and Exemptions: Permissions from the State Water Resources Control Board (State Board) to exceed an MCL or not comply with a treatment technique under certain conditions.</li> <li>Level 1 Assessment: A Level 1 assessment is a study of the water</li> </ul>  |
| Maximum Residual Disinfectant Level (MRDL): This highest level of a disinfectant allowed in drinking was There is convincing evidence that addition of a disinfect is necessary for control of microbial contaminants.<br>Maximum Residual Disinfectant Level Goal (MRDL) The level of a drinking water disinfectant below which the is no known or expected risk to health. MRDLGs do reflect the benefits of the use of disinfectants to continue microbial contaminants.<br>Primary Drinking Water Standards (PDWS): MCLs a MRDLs for contaminants that affect health along with the monitoring and reporting requirements, and water treatmarequirements. | <ul> <li>ter. Level 2 Assessment: A Level 2 assessment is a very detailed study of the water system to identify potential problems and determine (if possible) why an <i>E. coli</i> MCL violation has occurred and/or why total coliform bacteria have been found in our water system on multiple occasions.</li> <li>ND: not detectable at testing limit ppm: parts per million or milligrams per liter (mg/L) ppb: parts per billion or manograms per liter (μg/L)</li> <li>and ppt: parts per quadrillion or picogram per liter (pg/L)</li> </ul> |

**The sources of drinking water** (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

## Contaminants that may be present in source water include:

- *Microbial contaminants*, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- *Inorganic contaminants*, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- *Pesticides and herbicides*, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- *Radioactive contaminants*, that can be naturally-occurring or be the result of oil and gas production and mining activities.

**In order to ensure that tap water is safe to drink**, the U.S. EPA and the State Board prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. The U.S. Food and Drug Administration regulations and California law also establish limits for contaminants in bottled water that provide the same protection for public health.

Tables 1, 2, 3, 4, 5, and 6 list all of the drinking water contaminants that were detected during the most recent sampling for the constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The State Board allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of the data, though representative of the water quality, are more than one year old. Any violation of an AL, MCL, MRDL, or TT is asterisked. Additional information regarding the violation is provided later in this report.

## **Additional General Information on Drinking Water**

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the U.S. EPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. U.S. EPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Lead-Specific Language: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Indian Creek westridge CSD is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you do so, you may wish to collect the flushed water and reuse it for another beneficial purpose, such as watering plants.] If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline (1-800-426-4791) or at <a href="http://www.epa.gov/lead">http://www.epa.gov/lead</a>.

## For Water Systems Providing Groundwater as a Source of Drinking Water

| TABLE 7 – SAMPLING RESULTS SHOWING<br>FECAL INDICATOR-POSITIVE GROUNDWATER SOURCE SAMPLES  |   |  |   |     |                              |  |  |
